EXPERIMENT-11: DEPLOYING APPLICATION TO PRODUCTION

AIM

To understand and perform the deployment lifecycle of the Student Admission Management System in Zoho Creator by managing development and production environments, validating the application, and publishing changes safely.

OVERVIEW

Zoho Creator provides separate environments to test application changes and publish approved versions for live use. The Student Admission Management System can be added to an environment, reviewed in the Stage environment, and published to Production after validation.

This process helps reduce the risk of untested changes affecting live student admission records.

ENVIRONMENT / FEATURE

1. Development
Build and modify student admission forms, reports, workflows, and dashboard components.

2. Stage
Validate the student admission application and test changes before making them live.

3. Production
Live version used for actual student admission records processing and management.

4. Publish
Move the approved application version to the selected environment.

PROCEDURE

1. Open Environments: From the Zoho Creator home page, select Environments under the Deploy section.

2. Select the Application: Locate Student Admission Management System. If it is not listed in an environment, use Manage → Add Applications, select the application, and click Add.

3. Review Stage and Production: Check whether the application appears in the environment view with Stage and Production columns.

4. Validate Before Publishing: In the development application, test student details, admission application fields, required fields, workflows, reports, dashboard components, and role permissions. Check that sample records behave as expected.

5. Publish to Stage: Click Publish and choose Stage → Publish to Stage to publish the validated version to the staging environment, if supported by the account.

6. Test in Stage: Open the staged version and test key tasks using sample data. Verify student admission submission, course details, admission status, reports, and access permissions.

7. Publish to Production: After successful testing and review, choose Publish → Production and follow the confirmation prompts. Publish only when the application is ready for live users.

8. Verify Production: Open the Production version and confirm that the application is accessible and that forms, reports, workflows, and permissions behave correctly. Avoid testing with real sensitive student admission records.

RESULT

The deployment process for the Student Admission Management System was studied and documented using the development, Stage, and Production environment concepts in Zoho Creator. The application should be published to Production only after successful validation and testing in Stage.
