EXP 10: Performance Optimization in Zoho Creator

AIM

To study and implement performance optimization techniques in Zoho Creator to improve application speed, reduce loading time, minimize unnecessary workflows, and enhance the overall efficiency of the Student Admission Management System.

PROBLEM STATEMENT

An educational institution uses a Zoho Creator application to manage student details, admission applications, course preferences, document verification, and admission status. As the number of applications increases, the system may become slow because reports retrieve unnecessary records and multiple workflows perform similar operations.

SOLUTION

Performance optimization techniques are proposed to improve the application's response time and efficiency.

• **Report Optimization:** Apply filters to display only relevant student admission records.

• **Workflow Optimization:** Remove duplicate workflows and avoid unnecessary triggers for admission status updates.

• **Deluge Script Optimization:** Reduce repeated database queries and simplify conditions in admission-related scripts.

• **Form Optimization:** Include only necessary student admission fields and validations.

• **Data Retrieval Optimization:** Fetch only the required student records and fields.

• **Testing:** Compare application performance before and after optimization.

Expected Result: The Student Admission Management System should load reports faster, execute workflows more efficiently, and provide a better user experience.

EXPECTED OBSERVATION

S. No.	Observation	Result
1	Initial application performance	Reports may load slowly
2	Filters applied to admission reports	Only relevant student admission records are displayed
3	Duplicate workflows removed	Unnecessary executions are reduced
4	Deluge scripts optimized	Redundant operations are minimized
5	Application tested after optimization	Improved efficiency is expected

PROCEDURE

1. Log in to Zoho Creator and open the Student Admission Management System.
2. Identify performance issues in the Student Admission form, reports, and workflows.
3. Apply filters to reports to retrieve only the required student admission records.
4. Review duplicate workflows and optimize Deluge scripts where necessary.
5. Reduce unnecessary data retrieval and processing.
6. Test the application and compare its performance before and after optimization.

RESULT

Performance optimization techniques in Zoho Creator were studied for the Student Admission Management System. The proposed optimization methods help reduce unnecessary processing, improve report response time, and increase application efficiency.

CONCLUSION

Thus, performance optimization in Zoho Creator was studied successfully. By optimizing student admission reports, workflows, Deluge scripts, and data retrieval, the application's performance and responsiveness can be improved, resulting in efficient student admission management and a better user experience.
