EXP 12: Security and Governance in Zoho Creator

AIM

To study and implement security and governance features in Zoho Creator to protect sensitive student admission data, control user access, and ensure secure application management.

PROBLEM STATEMENT

An educational institution uses Zoho Creator to manage student details, admission applications, course preferences, document verification, and admission status. Unauthorized access to student information or unauthorized changes to admission records could result in data leakage, misuse, or incorrect admission records.

SOLUTION

The following security and governance measures are proposed for the Student Admission Management System:

• **Administrator:** Can manage users, student admissions, and application settings.

• **Admission Officer:** Can view, verify, and update permitted student admission records.

• **Student Applicant:** Can submit admission applications and view only permitted application details.

• **Access Control:** Configure permissions for student admission forms, reports, and records.

• **Data Protection:** Restrict access to student contact details, admission documents, personal information, and other private data.

• **Monitoring:** Review access permissions and audit information where available.

Expected Result: The Student Admission Management System provides controlled access to information and reduces the risk of unauthorized activities.

EXPECTED OBSERVATION

S. No.	Observation	Result
1	User roles created	Access categorized by role
2	Permissions configured	Unauthorized access restricted
3	Record-level access applied	Admission records controlled according to permissions
4	Different roles tested	Access rules verified
5	Security settings reviewed	Application security improved

PROCEDURE

1. Log in to Zoho Creator and open the Student Admission Management System.

2. Create or review user roles such as Administrator, Admission Officer, and Student Applicant.

3. Configure permission sets to control access to student admission forms, reports, and records.

4. Set appropriate field permissions and record-level access rules to protect student information.

5. Review API access, data visibility, authentication, and application-sharing settings.

6. Test the application using different user roles, where test accounts are available.

7. Verify that users can access only the admission records and application features permitted to them.

RESULT

Security and governance features were studied in Zoho Creator for the Student Admission Management System. Permissions can be configured to control access to student admission records, and additional security and administration practices can be examined.

CONCLUSION

Thus, security and governance in Zoho Creator were studied successfully. Role-based permissions, access controls, authentication, and monitoring help protect student information and ensure secure management of the Student Admission Management System.
